Operating / Parts Information

You must be familiar with the operation of this machine before you attempt to troubleshoot or repair it. Basic operating and maintenance procedures are described in the Operator’s Manual supplied with the machine. Keep a copy of the Operator’s Manual with the machine at all times. Use the separate Parts Book supplied with the machine to order replacement parts. If you are missing either of the documents, please contact Wacker Corporation to order a replacement.

Damage caused by misuse or neglect of the unit should be brought to the attention of the operator to prevent similar occurrences from happening in the future.

This manual provides information and procedures to safely repair and maintain the above Wacker model(s). For your own safety and protection from injury, carefully read, understand, and observe all instructions described in this manual. THE INFORMATION CONTAINED IN THIS MANUAL IS BASED ON MACHINES MANUFACTURED UP TO THE TIME OF PUBLICATION. WACKER CORPORATION RESERVES THE RIGHT TO CHANGE ANY PORTION OF THIS INFORMATION WITHOUT NOTICE.
CALIFORNIA

Proposition 65 Warning:

Engine exhaust, some of its constituents, and certain vehicle components, contain or emit chemicals known to the State of California to cause cancer and birth defects or other reproductive harm.

Laws Pertaining to Spark Arresters

Notice: State Health Safety Codes and Public Resources Codes specify that in certain locations spark arresters be used on internal combustion engines that use hydrocarbon fuels. A spark arrester is a device designed to prevent accidental discharge of sparks or flames from the engine exhaust. Spark arresters are qualified and rated by the United States Forest Service for this purpose.

In order to comply with local laws regarding spark arresters, consult the engine distributor or the local Health and Safety Administrator.

1. Safety Information

This manual contains DANGER, WARNING, CAUTION, NOTICE and NOTE callouts which must be followed to reduce the possibility of personal injury, damage to the equipment, or improper service.

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

DANGER indicates a hazardous situation which, if not avoided, will result in death or serious injury.

WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE: Used without the safety alert symbol, NOTICE indicates a hazardous situation which, if not avoided, could result in property damage

Note: Contains additional information important to a procedure.
1.1 Operating Safety

Familiarity and proper training are required for the safe operation of equipment. Equipment operated improperly or by untrained personnel can be dangerous. Read the operating instructions contained in both this manual and the engine manual and familiarize yourself with the location and proper use of all controls. Inexperienced operators should receive instruction from someone familiar with the equipment before being allowed to operate the machine.

1.1.1 NEVER allow anyone to operate this equipment without proper training. People operating this equipment must be familiar with the risks and hazards associated with it.

1.1.2 NEVER touch the engine or muffler while the engine is on or immediately after it has been turned off. These areas get hot and may cause burns.

1.1.3 NEVER use accessories or attachments that are not recommended by Wacker. Damage to equipment and injury to the user may result.

1.1.4 NEVER pump volatile, flammable or low flash point fluids. These fluids could ignite or explode.

1.1.5 NEVER pump corrosive chemicals or water containing toxic substances. These fluids could create serious health and environmental hazards. Contact local authorities for assistance.

1.1.6 NEVER open the priming plug when the pump is hot. Never loosen or remove inlet or discharge hose fittings when the pump is hot. Hot water inside could be pressurized much like the radiator on an automobile. Allow the pump to cool to the touch before loosening the plug and before loosening or removing the inlet or discharge hose fittings.

1.1.7 NEVER open pump housing cover while pump is operating, or start pump with the cover off. The rotating impeller inside the pump can cut or sever objects caught in it.

1.1.8 NEVER block or restrict flow from inlet line or discharge line. Remove kinks from discharge line before starting pump. Operation with a blocked inlet line or discharge line can cause water inside pump to overheat.

1.1.9 NEVER stand on the machine.

1.1.10 DO NOT stand under the machine while it is being hoisted or moved.

1.1.11 DO NOT attach equipment to the machine when it is suspended.

1.1.12 ALWAYS read, understand, and follow procedures in the Operator’s Manual before attempting to operate the equipment.

1.1.13 ALWAYS be sure operator is familiar with proper safety precautions and operation techniques before using machine.
1.1.14 ALWAYS be sure the machine is on a firm, level surface and will not tip, roll, slide, or fall while operating.

1.1.15 ALWAYS close fuel valve on engines equipped with one when machine is not being operated.

1.1.16 ALWAYS store the equipment properly when it is not being used. Equipment should be stored in a clean, dry location out of the reach of children.

1.2 Operator Safety while using Internal Combustion Engines

Internal combustion engines present special hazards during operation and fueling. Read and follow the warning instructions in the engine owner’s manual and the safety guidelines below. Failure to follow the warnings and safety guidelines could result in severe injury or death.

1.2.1 DO NOT smoke while operating the machine.

1.2.2 DO NOT smoke when refueling the engine.

1.2.3 DO NOT refuel a hot or running engine.

1.2.4 DO NOT refuel the engine near an open flame.

1.2.5 DO NOT spill fuel when refueling the engine.

1.2.6 DO NOT run the engine near open flames.

1.2.7 ALWAYS refill the fuel tank in a well-ventilated area.

1.2.8 ALWAYS replace the fuel tank cap after refueling.
1.3 Service Safety

Poorly maintained equipment can become a safety hazard! In order for the equipment to operate safely and properly over a long period of time, periodic maintenance and occasional repairs are necessary.

1.3.1 DO NOT attempt to clean or service the machine while it is running.Rotating parts can cause severe injury.

1.3.2 DO NOT crank a flooded engine with the spark plug removed on gasoline-powered engines. Fuel trapped in the cylinder will squirt out the spark plug opening.

1.3.3 DO NOT test for spark on gasoline-powered engines if the engine is flooded or the smell of gasoline is present. A stray spark could ignite the fumes.

1.3.4 DO NOT use gasoline or other types of fuels or flammable solvents to clean parts, especially in enclosed areas. Fumes from fuels and solvents can become explosive.

1.3.5 ALWAYS keep the area around the muffler free of debris such as leaves, paper, cartons, etc. A hot muffler could ignite the debris and start a fire.

1.3.6 ALWAYS replace worn or damaged components with spare parts designed and recommended by Wacker Corporation.

1.3.7 ALWAYS disconnect the spark plug on machines equipped with gasoline engines, before servicing, to avoid accidental start-up.
1.4 Label Locations
1.5 Safety Labels

Wacker machines use international pictorial labels where needed. These labels are described below:

<table>
<thead>
<tr>
<th>Label</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| ![DANGER Icon](image1) | **DANGER!**  
Engines emit carbon monoxide; operate only in well-ventilated area. Read the Operator’s Manual.  
No sparks, flames, or burning objects near the machine. Shut off the engine before refueling. |
| ![WARNING Icon](image2) | **WARNING!**  
Hot surface! |
| ![CAUTION Icon](image3) | **CAUTION!**  
Read and understand the supplied Operator’s Manuals before operating this machine. Failure to do so increases the risk of injury to yourself or others. |
| ![WARNING Icon](image4) | **WARNING!**  
Pressurized contents. Do not open when hot! |
| ![Impeller Rotation Icon](image5) | Impeller rotation. |
| ![Guaranteed Sound Power Level Icon](image6) | Guaranteed sound power level in dB(A) |
A nameplate listing the model number, item number, revision number, and serial number is attached to each unit. Please record the information found on this plate so it will be available should the nameplate become lost or damaged. When ordering parts or requesting service information, you will always be asked to specify the model number, item number, revision number, and serial number of the unit.

This machine may be covered by one or more patents.

2.2 Sound Specifications—PG 2 Machines with Honda Engines

The required sound specification, Paragraph 1.7.4.f of 89/392/EEC Machinery Directive, is:
- the sound pressure level at operator’s location \((L_{PA}) = 84\, \text{dB(A)}\)
- the guaranteed sound power level \((L_{WA}) = 103\, \text{dB(A)}\)

These sound values were determined according to ISO 3744 for the sound power level \((L_{WA})\) and ISO 6081 for the sound pressure level \((L_{PA})\) at the operator’s location.

2.5 Sound Specifications—PG 3 Machines with Honda Engines

The required sound specification, Paragraph 1.7.4.f of 89/392/EEC Machinery Directive, is:
- the sound pressure level at operator’s location (L_{PA}) = 87 dB(A)
- the sound power level (L_{WA}) = 108 dB(A)

These sound values were determined according to ISO 3744 for the sound power level (L_{WA}) and ISO 6081 for the sound pressure level (L_{PA}) at the operator’s location.

The sound and vibration specifications were obtained with the unit operating on pavement at nominal engine speed.

* Based on pump operating at sea level. Maximum suction lift will be less at higher altitudes.

2.9 Sound Specifications—Machines with Wacker Engines

The required sound specification, Paragraph 1.7.4.f of 89/392/EEC Machinery Directive, is:

- the sound pressure level at operator's location ($L_{pA}$):
  
  - PG 2 = 84 dB(A), PG 3 = 87 dB(A).

- the guaranteed sound power level ($L_{WA}$):
  
  - PG 2 = 103 dB(A), PG 3 = 105 dB(A).

These sound values were determined according to ISO 3744 for the sound power level ($L_{WA}$) and ISO 6081 for the sound pressure level ($L_{pA}$) at the operator's location.
3. Operation

3.1 Application

This pump is intended for removing clean water and water containing some debris and solids. Refer to “Technical Data” for maximum solid size.

3.2 Recommended Fuel

The engine requires regular grade unleaded gasoline. Use only fresh, clean gasoline. Gasoline containing water or dirt will damage fuel system. Consult engine Owner’s Manual for complete fuel specifications.
3.3 Before Starting

*See Graphic: wc_gr000835*

3.3.1 Read safety instructions at the beginning of manual.

3.3.2 Place pump as near to water as possible, on a firm, flat, level surface.

3.3.3 To prime pump, remove prime plug (a) and fill pump case with water. If the pump case is not filled with water before starting, it will not begin pumping.

DO NOT open priming plug, discharge plug, or loosen hose fittings if pump is hot! Water or vapor inside pump may be under pressure.

3.3.4 Check for leaks between pump and engine. If water is leaking, the seal inside pump is worn or damaged. Continued operation may cause water damage to engine.

3.3.5 Check that hoses are securely attached to pump. Suction hose (b) must not have any air leaks. Tighten hose clamps (c) and couplings (d). Check that discharge hose (e) is not restricted. Lay hose out as straight as possible. Remove any twists or sharp bends from hose which may block the flow of water.

3.3.6 Make sure suction strainer (f) is clean and securely attached to end of hose. The strainer is designed to protect the pump by preventing large objects from being pulled into the pump.

**NOTICE:** Strainer should be positioned so it will remain completely under water. Running the pump with the strainer above water for long periods can damage the pump.

3.3.7 Check fuel level, engine oil level, and condition of air cleaner.
3.4 To Start—Machines with Honda Engines

See Graphic: wc_gr000014

3.4.1 Open fuel valve by moving lever to the right (a1).

**Note:** If engine is cold, move choke lever to close position (b1). If engine is hot, set choke to open position (b2).

3.4.2 Turn engine switch to “ON” (e1).

3.4.3 Open throttle by moving it slightly to left (d1).

3.4.4 Pull starter rope (c).

**Note:** If the oil level in the engine is low, the engine will not start. If this happens, add oil to engine. Some engines are equipped with an oil alert light (f) that will come on while pulling the starter rope.

3.4.5 Open choke as engine warms (b2).

3.4.6 Open throttle fully to operate.

3.5 To Stop—Machines with Honda Engines

See Graphic: wc_gr000014

3.5.1 Reduce engine RPM to idle by moving throttle completely to right (d2).

3.5.2 Turn engine switch to “OFF” (e2).

3.5.3 Close fuel valve by moving lever to the left (a2).
3.6 To Start—Machines with Wacker Engines

See Graphic: wc_gr000655

3.6.1 Open fuel valve by moving lever down (a1).

**Note:** If engine is cold, move choke lever to close position (d2). If engine is hot, set choke to open position (d1).

3.6.2 Turn engine switch to “ON” (b2).

3.6.3 Open throttle by moving it slightly to left (c2).

3.6.4 Pull starter rope (e).

**Note:** If the oil level in the engine is low, the engine will not start. If this happens, add oil to engine.

3.6.5 Open choke as engine warms (d1).

3.6.6 Open throttle fully to operate (c1).

3.7 To Stop—Machines with Wacker Engines

See Graphic: wc_gr000655

3.7.1 Reduce engine RPM to idle by moving throttle completely to right (c3).

3.7.2 Turn engine switch to “OFF” (b1).

3.7.3 Close fuel valve (a2).
3.8 Operation

Pump should begin pumping water within a minute depending on length of suction hose and height of pump above water. Longer hoses will require more time.

If pump does not prime, check for loose fittings or air leak in suction hose. Make sure strainer in water is not blocked.

Run engine at full speed while operating pump.

NEVER pump corrosive chemicals or water containing toxic substances. These fluids could create serious health and environmental hazards. Contact local authorities for assistance.

3.9 Hoses and Clamps

See Graphic: wc_gr000836

Suction hoses (a) must be rigid enough not to collapse when pump is operating.

Discharge hoses (b) are usually thin-walled collapsible hoses. Rigid hoses similar to those used as suction hoses may also be used as discharge hoses.

Note: Suction and discharge hoses are available from Wacker. Contact your nearest dealer for more information.

Two clamps (c) are recommended for connection of suction hoses to inlet coupling.

Note: This connection is important. Even a small air leak on the suction side of pump will prevent the pump from priming.

For other hose connections, one T-bolt or worm-gear type clamp is usually sufficient to hold hoses in place. In some cases, slight variances in hose diameters may make it necessary to add more clamps in order to maintain tight connections.
4. Maintenance

4.1 Periodic Maintenance Schedule

4.2 Cleaning Pump

See Graphic: wc_gr000837

After pumping water containing a large amount of dirt or debris, clean out inside of pump housing.

4.2.1 Remove drain plug (b) from pump housing and drain any water left in pump.
4.2.2 Loosen the four knobs holding the pump cover (a) and remove cover.
4.2.3 Clean out dirt and debris. Inspect impeller and volute insert for wear.

The impeller may develop sharp edges. Use care when cleaning around impeller to avoid getting cut.

⚠️ WARNING
4.3 Adjusting Impeller Clearance

See Graphic: wc_gr000838

If it is necessary to replace impeller or volute, be sure clearance between impeller and volute is adjusted correctly. The impeller (a) should be as close to the volute (b) as possible without rubbing against it. Clearance is adjusted by adding or removing shims (c) from behind impeller. To adjust the clearance do the following:

4.3.1 Remove pump housing but do not remove impeller.
4.3.2 Measure the distance (d) of volute.
4.3.3 Measure the distance (e) of impeller.
4.3.4 Subtract the distance (e) from (d).
    \[ (d) - (e) = (f) \] clearance.
4.3.5 The clearance between the volute and the impeller should be 0.3 mm (0.012 in.) to 0.7 mm (0.028 in.). Adjust the distance by removing the impeller and adding shims as needed.

Each shim measures 0.3 mm (0.012 in.).

As the impeller wears down, additional shims may be required to maintain the clearance between the impeller and the volute. Check the clearance whenever the mechanical seal (g), impeller, volute, or rear flange plate are replaced.
### 4.4 Mechanical Seal Replacement

*See Graphic: wc_gr000839*

To service the mechanical seal do the following:

4.4.1 Remove the impeller (a) from the engine shaft by turning it counterclockwise.

**Note:** *If the impeller is hard to remove, tap it with a plastic mallet. Do not lose any adjusting shims (b).*

4.4.2 Remove mechanical seal spring (c) and carbon face (d) from crankshaft.

4.4.3 Remove mechanical seal ceramic face (e) and L-ring (f).

4.4.4 Clean engine shaft, remove any rust. Also clean contact surface of ceramic and carbon faces with a clean cloth. Do not lubricate seal faces.

4.4.5 Place ceramic face in L-ring and install in pump flange. Carefully place carbon face and seal spring on engine shaft.

4.4.6 Mount impeller to engine shaft. Turn impeller shaft clockwise to tighten. See Section *Adjusting Impeller Clearance.*
4.5 Spark Plug

See Graphic: wc_gr000028

Clean or replace spark plug as needed to ensure proper operation.

The muffler becomes very hot during operation and remains hot for a while after stopping the engine. Do not touch the muffler while it is hot.

**WARNING**

*Note:* Refer to the Technical Data for the recommended spark plug type and the electrode gap setting.

4.5.1 Remove spark plug and inspect it.
4.5.2 Replace plug if the insulator is cracked or chipped.
4.5.3 Clean spark plug electrodes with a wire brush.
4.5.4 Set the electrode gap *(a).*
4.5.5 Tighten spark plug securely.

**NOTICE:** A loose spark plug can become very hot and may cause engine damage.
4.6 Air Cleaner—Machines with Honda Engines

See Graphic: wc_gr000840

Service air cleaner frequently to prevent carburetor malfunction.

**NOTICE:** NEVER run engine without air cleaner. Severe engine damage will occur.

NEVER use gasoline or other types of low flash point solvents for cleaning the air cleaner. A fire or explosion could result.

**WARNING**

To service:

4.6.1 Remove air cleaner cover (a). Inspect element (b) for holes or tears. Replace element if damaged.

4.6.2 Wash element in solution of mild detergent and warm water. Rinse thoroughly in clean water. Allow element to dry thoroughly.

Soak element in clean engine oil and squeeze out excess oil.

4.6.3 Install element, grid plate (c), and air cleaner cover.
4.7 Air Cleaner—Machines with Wacker Engines

See Graphic: wc_gr000656

NEVER use gasoline or other types of low flash point solvents for cleaning the air cleaner. A fire or explosion could result.

**WARNING**

**NOTICE:** NEVER run engine without air cleaner. Severe engine damage will occur.

The engine is equipped with a dual element air cleaner. Under normal operating conditions, elements should be cleaned once every week. Under severe, dry and dusty conditions, the elements should be maintained daily. Replace an element when saturated with dirt that cannot be removed.

4.7.1 Remove the air cleaner cover (a). Remove the filter assembly by pulling it straight up. Inspect both elements for holes or tears. Replace damaged elements.

4.7.2 Wash the foam element (b) in a solution of mild detergent and warm water. Rinse it thoroughly in clean water. Allow the element to dry thoroughly.

4.7.3 Tap the paper element (c) lightly to remove excess dirt or blow compressed air through the filter from the inside out. Replace the paper element if it appears heavily soiled.
4.8 Engine Oil—Machines with Honda Engines

See Graphic: wc_gr000022

4.8.1 Drain the oil while the engine is still warm.

4.8.2 Remove the oil filler plug (a) and the drain plug (b) to drain the oil.

Note: In the interests of environmental protection, place a plastic sheet and a container under the machine to collect any liquid that drains off. Dispose of this liquid in accordance with environmental protection legislation.

4.8.3 Install the drain plug.

4.8.4 Fill the engine crankcase with the recommended oil up to the level of the plug opening (c). See Technical Data for oil quantity and type.

4.8.5 Install the oil filler plug.

4.9 Cleaning Sediment Cup—Machines with Honda Engines

See Graphic: wc_gr000029

4.9.1 Turn the fuel valve off.

4.9.2 Remove the sediment cup (a) and the O-ring (b).

4.9.3 Wash both thoroughly in a nonflammable solvent. Dry and reinstall them.

4.9.4 Turn the fuel valve on and check for leaks.
4.10 Changing Engine Oil—Machines with Wacker Engines

See Graphic: wc_gr000087

4.10.1 Drain oil while engine is still warm.

*Note: In the interests of environmental protection, place a plastic sheet and a container under the machine to collect any liquid which drains off. Dispose of this liquid in accordance with environmental protection legislation.*

4.10.2 Remove the oil drain plug (a).

4.10.3 Allow the oil to drain.

4.10.4 Install the drain plug.

4.10.5 Fill the engine crankcase through the oil filler opening (b), to the upper mark on the dipstick (c). Do not thread in the dipstick to check the level. See Technical Data for oil quantity and type.

4.10.6 When the crankcase is full, reinstall the dipstick.

4.11 Cleaning Fuel Strainer—Machines with Wacker Engines

See Graphic: wc_gr001093

4.11.1 To remove water and dirt, close the fuel lever and remove the fuel strainer.

4.11.2 Inspect the fuel strainer (a) for water and dirt.

4.11.3 After removing any dirt and water, wash the fuel cup with a nonflammable solvent.

4.11.4 Reinstall securely to prevent leakage.
4.12 Carburetor Adjustment—Machines with Honda Engines

See Graphic: wc_gr000032

4.12.1 Start the engine and allow it to warm up to operating temperature.
4.12.2 Set the pilot screw (a) two turns out. See Note.
4.12.3 With the engine idling, turn the pilot screw (a) in or out to the setting that produces the highest rpm.
4.12.4 After the pilot screw is adjusted, turn the throttle stop screw (b) to obtain the standard idle speed. See Technical Data.

Note: On some engines the pilot screw is fitted with a limiter cap (c) to prevent excessive enrichment of the air-fuel mixture in order to comply with emission regulations. The mixture is set at the factory and no adjustment should be necessary. Do not attempt to remove the limiter cap. The limiter cap cannot be removed without breaking the pilot screw.

4.13 Adjusting Idle Speed—Machines with Honda Engines

See Graphic: wc_gr000032

To adjust idle speed:
4.13.1 Start engine and allow it to warm up to normal operating temperature.
4.13.2 Turn throttle stop screw (b) in to increase speed, out to decrease speed.
4.14 Storage

If pump is being stored for more than 30 days:

⚠️ WARNING

NEVER open priming plug, discharge plug, or cover when pump is hot.

4.14.1 Remove discharge plug from pump casing and drain out any water left in the housing after pump has cooled.

4.14.2 Remove pump cover and clean inside of pump housing. Coat inside of pump with a light film of oil to reduce corrosion. A spray can of oil works well for this.

4.14.3 Tape up suction and discharge ports to prevent anything from falling into pump.

4.14.4 Change engine oil and follow procedures described in engine manual for engine storage.

4.14.5 Cover pump and engine and store in a clean, dry area.
### 4.15 Troubleshooting

<table>

</tbody>
</table>
5. Disassembly/Assembly Procedures

5.1 Tools

Because all possible problems encountered while repairing the machine cannot be anticipated, it is up to the mechanic to use common sense and good judgement in tool selection.

The use of any special tools is recommended only for those operations where the use of conventional tools proves inadequate.

Before substituting another tool or procedure, you should be satisfied that neither personal injury nor damage to the component will result.

5.2 Ordering Parts

The repair procedures contained in this manual do not include part numbers. For parts replacement information, refer to the Parts Book originally supplied with the machine.

If the original Parts Book has been lost, a replacement may be ordered from Wacker Corporation. When ordering a replacement Parts Book, please list the model number, item number, revision level, and serial number of the machine. Parts Books are also available on the Wacker Corporation Web site. See www.wackergroup.com. Enter the site as a visitor.

5.3 Reference Numbers ( )

Repair procedures contain reference numbers enclosed in parentheses ( ). These numbers refer to the item numbers shown on the assembly drawings and other detailed drawings. They are included to aid the mechanic in identifying parts and assembling components.
5.4 Description and Operation

See Graphic: wc_gr003495

PG Series Pumps use an impeller (1) and volute (2) to create the suction and discharge pressures required for pump operation.

The impeller is threaded directly to the engine drive shaft (3) and rotates inside the volute casing. Water is drawn into the pump inlet (4) by the low pressure area created at the eye of the impeller. Vanes on the impeller move the liquid into the volute where it is gathered and directed to the discharge port (5).

Clearance between the impeller and the volute is maintained by the addition of shim washers (6) behind the impeller.

A mechanical seal (8), mounted behind the impeller, prevents water from running along the engine drive shaft and seals the rear of the pump housing to prevent leakage.

The flapper valve (9) at the pump inlet closes when the pump stops. This valve seals the inlet port and prevents the prime water in the suction hose from being lost.

The pump case is easily filled with water by removing the priming plug (10).
5.5 Inspection

Before disassembling the pump, check for conditions both outside and inside the pump which could affect performance.

Inspecting conditions outside the pump:

- Check that the pump is operating within specifications
  Remember that as suction lift and discharge head increases, pump output is reduced.

- Check the type of fluid being pumped.
  The pump will perform poorly if it is used to pump heavy sludges or mud.

- Check the suction hose for leaks or damage.
  A puncture or tear above the water line will make the pump difficult or impossible to prime.

- Check that the suction hose is the correct type.
  The suction hose must have strong rigid walls. Thin-walled collapsible hoses like those used on the discharge side cannot be used.

- Check that the strainer hose lines are not blocked or restricted.
  Remove any dirt, debris or vegetation which might interfere with the fluid flow. If possible, flush the hoses with clear water at the end of each operation and suspend the strainer in water, rather than resting it in sand or mud. Check that the discharge hose is not kinked.

- Check that all the fittings and hose clamps on the suction line are tight and sealed properly.
  The fittings and clamps may loosen during operation. Add additional clamps where necessary to ensure a good seal.

- Check that the pump case is filled with water and the prime plug is sealed tightly before start up.

Inspecting conditions inside the pump:

- Check for debris and dirt inside the pump casing.
  If allowed to accumulate, debris may restrict fluid flow through the pump or impede the movement of the impeller.

- Check the engine operating speed— 3600 ±100 rpm.
  As engine operating rpm falls, the pump capacity and discharge head are reduced.
• Check the flapper valve and inlet port for leaks or damage. If the flapper valve is worn or distorted, it may not seal tightly. Inspect the threads on the inlet port nipple for deep scratches which could allow air leaks.

• Check the clearance between the impeller and the volute insert. Additional shims are required to maintain the clearance as the impeller wears.

• Check the pump housing O-ring and rear pump flange. Replace the O-ring if it is torn or crushed. Make sure the cover is tightened evenly. Check that the rear plate is not warped.

• Check for water leaks between the pump housing and the engine. Inspect the mechanical seal lubricant and engine oil. The presence of water indicates a loose impeller bolt or damage to the mechanical seal.

• Check for oil leaks between the pump housing and the engine. An oil leak indicates a failed shaft seal.

• Check the pump suction with a vacuum gauge. If the gauge reading is above 16 in. Hg (55 KPa), the problem is probably outside the pump, in the hose line or fittings.

</table>
5.8 Replacing the Flapper Valve

See Graphic: wc_gr003497

The flapper valve (1) is located at the pump inlet (2). During operation, this valve is open allowing a free path for water to flow into the pump case. When the pump is stopped, it closes and prevents water in the suction line from being lost.

A leak around the flapper gasket will cause the suction line to lose its prime and make the pump difficult or impossible to operate.

Removal:

5.8.1 Remove the three screws (3) that secure the suction (inlet) port (2) to the pump.
5.8.2 Remove the inlet port and flapper valve assembly (1).

Installation:

5.8.3 Install the new flapper valve assembly (1) with the large washer (4) facing the suction port. This washer acts as a counterweight and helps seal the flapper gasket against the pump inlet when the pump stops.
5.8.4 Mount the suction (inlet) port (2) to the pump. Tighten the screws (3) evenly until the flapper gasket begins to compress. Use Loctite 243 or an equivalent medium-strength threadlocker on the screws.

NOTICE: DO NOT overtighten the screws. Overtightening may distort the flapper gasket causing an air leak at the suction (inlet) port.
5.9 Frame Assembly

See Graphic: wc_gr003498

Removal:

5.9.1 Remove the four screws (1) and nuts (2) to secure the pump/engine (3) to the frame (4).

Installation:

5.9.2 Secure the pump/engine (3) to the frame (4) using screws (1) and nuts (2). Apply Loctite 243 or an equivalent medium-strength threadlocker to the screws and torque them to 35 Nm (26 ft.lbs.).
5.10 Pump Housing

See Graphic: wc_gr003499

Removal:

5.10.1 Remove the drain plug (5) from the bottom of the pump housing and drain the water from the pump housing.

5.10.2 Remove the four screws (6) securing the pump housing (7) to the back pump flange (8).

5.10.3 Lightly tap the pump housing with a plastic mallet to break the seal, and remove the pump housing.

5.10.4 Thoroughly clean any debris from the pump housing (7), volute (9), and flange (8).

5.10.5 Remove the volute (9) and the clean O-ring (10) and the intake port.

Installation:

5.10.6 Check the clearance between the impeller (11) and the volute (9). Add shims as required. See section Adjusting Impeller Clearance.

5.10.7 Inspect the O-rings (12 and 10). Grease the O-rings lightly before assembly. Make sure the areas where the O-rings seat are clean.

5.10.8 Mount the pump housing (7) to the flange (8). Secure evenly with the screws (6). Torque the screws to 37 Nm (26 ft.lbs.).

Note: The pump housing MUST seal flush around the rear flange. Replace the pump flange if it appears warped or bent.
5.11 Impeller

See Graphic: wc_gr003500

CAUTION: When replacing either the impeller (1) or the rear pump flange (2), make note of the I.D. numbers found on back of each component casting (3). MAKE SURE THE REPLACEMENT PARTS HAVE THE SAME NUMBER MARKINGS—THE PARTS ARE NOT INTERCHANGEABLE.

Removal:

5.11.1 Remove the pump housing. See section Pump Housing.

5.11.2 Unscrew the impeller (1) counterclockwise from the engine shaft (4).

5.11.3 Note: If the impeller is hard to remove, tap it with a plastic mallet. Do not lose any adjusting shims when removing the impeller.

5.11.4 Remove the four screws (5) and washers (6) securing the rear pump flange (2) to the engine.

Installation:

5.11.5 Secure the rear pump flange (2) to the engine with the screws (5) and washers (6). Apply Loctite 271 or an equivalent high-strength threadlocker to the screws and torque them to 22 Nm (16 ft.lbs.)

Note: Install rear pump flange with the drain channel facing down.

5.11.6 Install the mechanical seal. See section Replacing the Mechanical Seal.

5.11.7 Screw the impeller (1) clockwise onto the engine shaft. DO NOT apply any threadlocker to threads of the impeller or the engine shaft.
5.12 Replacing the Mechanical Seal

See Graphic: wc_gr003500

Removal:

5.12.1 Remove the impeller (1). See section Impeller. 
Note: Do not lose any adjusting shims (7).

5.12.2 Remove the mechanical seal spring (8) and the carbon face (9) from the engine shaft.

5.12.3 Remove the mechanical seal ceramic face (10) and L-ring (11) from the rear pump flange.

Installation:

5.12.4 Clean the engine shaft and remove any rust. Clean the contact surface of the mechanical seal ceramic and carbon faces with a clean cloth. DO NOT lubricate the seal faces.

5.12.5 Place the ceramic face (10) in the L-ring (11) and install it in the pump flange.

5.12.6 Carefully place the carbon face (9) and the seal spring (8) on the engine shaft.

5.12.7 Install the impeller to the engine shaft.
5.13 Testing

See Graphic: wc_gr003501

This procedure requires a vacuum gauge (P/N 28755) and a tachometer.

5.13.1 Fill the pump housing with cold water until it flows out from the discharge port.

5.13.2 Tighten the pump cover and the prime plug.

5.13.3 Bring the engine up to operating speed. Check the engine rpm with the tachometer. See chapter Technical Data for engine speeds.

Note: Keep the pump housing filled with water at all times while the pump is running. If too much water is lost during the test procedure, stop the engine and prime the pump. It may be necessary to tilt the pump or partially cover the discharge port, to prevent the water in the pump housing from being lost while still allowing air to be vented.

5.13.4 Grease the mounting face of the vacuum gauge (1) to ensure a good seal. Press the gauge over the inlet port.

5.13.5 The gauge reading should slowly climb and then hold steady.

With the gauge still against the inlet port, turn off the engine. The gauge reading should not change.

Note: See the vacuum chart for appropriate gauge readings.

This test MUST be completed within a few minutes of starting the pump to prevent the water in the pump housing from getting hot, which will result in lower readings. If possible, allow cold water to run into the discharge port while testing the pump.
Threadlockers and Sealants

Threadlocking adhesives and sealants are specified throughout this manual by a notation of “S” plus a number (S#) and should be used where indicated. Threadlocking compounds normally break down at temperatures above 175°C (350°F). If a screw or bolt is hard to remove, heat it using a small propane torch to break down the sealant. When applying sealants, follow instructions on container. The sealants listed are recommended for use on Wacker equipment.
